Something's Wrong!

Indications that something's not right

- **message:** A generic notification/diagnostic message produced by the `message` function; execution of the function continues
- **warning:** An indication that something is wrong but not necessarily fatal; execution of the function continues; generated by the `warning` function
- **error:** An indication that a fatal problem has occurred; **execution stops;** produced by the `stop` function
- **condition:** A generic concept for indicating that something unexpected can occur; programmers can create their own conditions

How do you know that something is wrong with your function?

- What was your input? How did you call the function?
- What were you expecting? Output, messages, other results?
- What did you get?
- How does what you get differ from what you were expecting?
- Were your expectations correct in the first place?
- Can you reproduce the problem (exactly)?
